

**ViewWatch™ requires a Java Virtual Machine (VM). The Microsoft Java VM is required for named ViewWatch™ stations and WatchBook™ stations. Either the Microsoft Java VM or the Sun Java VM can be used for anonymous ViewWatch™ stations. Some versions of the Sun Java VM are known to cause problems. If this occurs, disable the Sun Java VM.**

**This document describes the required Microsoft Internet Explorer Java VM settings.**

## Disabling Sun Java

1. In an open Internet Explorer window, click **Tools** in the toolbar.
2. Click **Internet Options** in the Tools menu.
3. Click on the **Advanced** tab.
4. Scroll down and locate the section labeled **Java (Sun)**. If there is no such section, the Sun Java VM is not installed.
5. Remove the check mark from the box labeled **Use Java version for <applet>**.
6. Close Internet Explorer.
7. Shutdown and restart the computer.

## Enabling The Java VM

1. In an open Internet Explorer window, click **View** in the toolbar.
2. If there is no check mark by **Status Bar**, click on **Status Bar**.
3. In the Status Bar at the bottom of the window, identify the content zone displayed on the right side of the bar.
4. Click **Tools** in the toolbar.
5. Click **Internet Options** in the Tools menu.
6. Click on the **Security** tab.
7. Click on the content zone icon at the top of the applet that corresponds to the zone identified in step 3.
8. If you are using default security settings, click the **Default Level** button. All default levels enable the Java VM.
9. If you are using custom security settings, click the Custom Level button, and verify that each of these settings is enabled:
  - Microsoft VM>Java permissions>High safety
  - Scripting>Active scripting
  - Scripting>Scripting of Java applets
10. Special Java permissions are required for named ViewWatch™ stations and WatchBook™ stations. Refer to the Admin Guide for details.
